Machines and systems for primary and secondary processing

British manufacturing and project engineering company, Alvan Blanch, has a global outlook, specialising for over 60 years in the design, production and supply of quality machines and integrated systems for the primary and secondary processing of agricultural produce and waste materials.

From their 9,000m² facility in Malmesbury, Alvan Blanch export to all over the world and are valued for the quality of their innovative and reliable products as much as for the personal service they provide.

To assist the control and management of the power cabling for their equipment they have chosen Tamlex of Telford as another British manufacturer to provide the solution. Specialist manufacturers in steel cable management and containment, Tamlex were also able to provide any special fabrications

that may be required to suit particular pieces of equipment.

Tamlex have been manufacturing since 1969 and despite the upheavals and changes in the steel market have continuously invested in the latest machinery to remain competitive.

The latest arrival has been a TruBend machine from Trumpf that represents the latest in press brake technology. With a 3D interface from design software to shop floor, tool set ups can be reduced and efficiencies increased which in turn leads to improved customer service.

“
Having a local manufacturer who can produce good quality product, at the right price and deliver on time... is just the right fit for us.
”
